

Make your next book one decision at a time

A practical browser guide from the first idea to a reviewed manuscript and release packet.

01 Save your idea

02 Shape the concept

03 Plan the book

04 Draft chapters

05 Verify details

06 Prepare release

You make the important decisions.

AI results stay experimental until you accept them. KDP publication stays manual.

Start with one idea

Begin on the Workspace home page. You do not need a command line or server access.

Start

Concept

Plan

Draft

Verify

Prepare

What to have ready

- A working title. It can be provisional; choose wording that helps you recognize the project.
- A reader description: age or life stage, interests, and what they need from the book.
- Two or three sentences about the book idea and the experience you want readers to have.
- A monthly AI spending limit and a maximum estimated cost for any one request, both in USD.

In the browser

Open **Workspace**, find **Start a new book**, and fill in your name, project name, working book title, intended reader, and idea. Select an available AI provider and set both spending limits. Choose **Create book and save idea**.

WHAT IS SAVED

The application creates a project, a title, and your human-written idea note. It also records your selected provider and hard spending limits. This step does **not** make an AI request.

Know the two containers

Project	The workspace for one book or a related set of books. Its provider and spending limits apply to work inside it.
Title	The individual book you open to develop its concept, plan, chapters, verification, and release packet.

IF YOU CANNOT START

If no provider appears, ask the system operator to configure a ready provider with model pricing. The browser cannot create a book without one. Do not enter an API key into a book form.

Shape the concept

Use the saved idea to work out who the book is for and what makes it worth creating.

Start

Concept

Plan

Draft

Verify

Prepare

Follow the concept path

Reader brief	Under Book authoring > Develop your idea, generate an audience brief. Check that it describes the intended reader accurately.
Options	Generate concept options. These are suggestions, not commitments. Choose an idea that fits your reader and purpose.
Concept brief	Develop the chosen option into a fuller concept brief. Read the complete result and use Edit in browser if you need to correct it.
Check	Run Check concept completeness. An advisory scorecard can help you notice gaps, but it does not approve the idea.
Human approval	Open the concept brief under Awaiting acceptance. Read its content, provenance, findings, blockers, and conditions before accepting it.

Questions to ask before accepting

- Can I explain this book in one or two plain sentences?
- Is the intended reader specific enough to guide writing choices without excluding people unnecessarily?
- Does the concept promise an experience or benefit the book can reasonably deliver?
- For fiction: are the story premise and reader appeal clear? For nonfiction: is the reader problem and practical value clear?

DECISION POINT

Acceptance is a human gate. If the concept is weak, revise the experimental brief and review the new version. When the concept is accepted, you can request a drafting brief and move into planning.

Plan the book

Turn the concept into a promise, structure, and chapter-by-chapter writing guide.

Build the plan in order

Positioning	Define the reader, the book's promise, its tone, and how it should be distinguished. Review and accept it, then advance to Validated when the gate allows.
Book brief	Set the scope, reader outcomes or story experience, voice, boundaries, and success criteria. Review and accept it.
Outline	Map the full journey of the book. Check the sequence, gaps, repetition, and whether the promised length and scope feel workable.
Chapter cards	Create a card for each chapter or entry. Each card should tell the writer what that part must accomplish and how it connects to the whole.

Use **Book authoring > Plan the book**. Open every generated item in **Awaiting acceptance**; a generated plan is not automatically the approved plan. When the required items are accepted, use **Advance to planned**.

A useful planning review

- Compare every chapter card with the accepted outline. Does each chapter have a distinct job?
- Check the audience and tone across positioning, brief, outline, and cards. They should point to the same book.
- Keep any claims, source needs, or rights questions visible for later verification.

IF A STAGE BUTTON IS BLOCKED

Open the title's planning and Awaiting acceptance sections. The system may be waiting for an accepted item or another required condition. Resolve the named requirement, then try the stage button again.

Draft and review chapters

Write one chapter at a time so each draft can be checked against the accepted plan.

Start

Concept

Plan

Draft

Verify

Prepare

The chapter cycle

1. Draft	Choose Start drafting stage, then Draft one chapter. Enter the chapter number that matches an accepted card.
2. Read	Open the experimental draft. Check the chapter's purpose, flow, tone, reader usefulness, and alignment with the card.
3. Analyze	Run continuity or developmental analysis when useful. Other editorial passes can focus on voice, line, copy, reader experience, or consistency.
4. Revise	Use Edit in browser for a manual revision, or request an AI revision if you choose. The original stays available; each new version remains experimental.
5. Accept	Open the chosen draft or revision under Awaiting acceptance. Review its content, provenance, findings, blockers, and any conditions before accepting it.
6. Continue	A chapter summary can carry continuity context into later work. Then repeat the cycle for the next chapter.

What acceptance means

Acceptance puts the chosen version into the manuscript's accepted chapter set. It does not mean every source, claim, or quotation is verified, or that the book is ready for KDP. Record unresolved conditions instead of hiding them.

EXAMPLE CONDITION

If a chapter contains **[SCRIPTURE NEEDED]**, leave it visible. Acceptance can carry a Scripture verification condition, but the reference must later be supplied and checked by a person. Never invent a quotation to clear the marker.

Verify before release

Use evidence and human judgment to clear material that the book depends on.

Start

Concept

Plan

Draft

Verify

Prepare

What needs checking?

Scripture	Scan accepted chapters for placeholders. A person supplies an exact reference and checks it against the project's source policy.
Sources	Check cited material and the exact statement it supports. Record a traceable evidence reference.
Claims	Flag statements that need factual support, qualification, or revision.
Research	Check research-derived points and whether the evidence applies to the reader and context.
Rights	Record third-party text, images, or other material and the evidence for permitted use or a decision not to use it.

On the title page, use **Workflow actions > Verification** to scan for placeholders or add a verification flag or rights record. Open each pending item from the title page or attention queue. The review page asks for a named reviewer, rationale, and evidence where needed.

A SCAN IS NOT VERIFICATION

The scan only finds placeholders in accepted chapters. It does not choose a reference, edit manuscript text, or mark anything verified. A recorded human decision must match the actual book content and evidence.

What a blocker tells you

A blocker is a visible reason the manuscript or release candidate is not ready. It can be a missing verification, unresolved approval condition, rights issue, or another preflight concern. Read the exact blocker before deciding what to change.

Build and prepare release

Assemble accepted content, inspect the packet, and keep publication under human control.

From chapters to review packet

Build	Choose Create Markdown build. The system assembles accepted chapters and records the included assets, file hashes, and build status.
Inspect	Read the build and its blockers. A blocked draft build can still help you review the manuscript; blocked does not mean release-ready.
Candidate	Create a release candidate from a selected build. It freezes a particular manuscript build for preflight review.
Packet	Export the review packet. It gathers the candidate, provenance, blockers, and other evidence for a human review.
Decision	The release review page shows the artefact, provenance, findings, conditions, blockers, and consequences before approval, hold, or rejection.

Before a positive release decision

- All intended chapters are accepted and the build contains the right versions in the right order.
- Scripture, source, claim, research, and rights questions have human evidence and decisions.
- No release blockers or unresolved approval conditions remain.
- The review packet matches the build and is understood by the person making the decision.

PUBLICATION BOUNDARY

This Workspace prepares and reviews the book. It does not upload to KDP or publish for you. Final KDP action remains manual and human-controlled.

Where to look in the Workspace

Workspace home	Start a new book, search for projects or titles, and see work needing attention first.
Your project	Open its titles and see the selected provider, budget, and usage summary.
Your title	Use Book authoring, Awaiting acceptance, Workflow actions, Verification, Builds, and Release.
Review page	Read the exact item and its context, then record an explicit human decision.

If something is not moving

- Look for a named blocker or missing accepted artefact before repeating an action.
- A failed or unclear AI request may still have incurred usage. Inspect its job and cost before deciding to retry.
- If generation is unavailable, check whether your project has a selected ready provider, configured pricing, and a hard budget. Ask the system operator for configuration help.
- If a review is unavailable, confirm the item is still experimental and its source content has not changed.

YOUR REPEATABLE ROUTINE

Open the title -> inspect Attention -> do one action -> read its result -> review or revise -> accept only when ready -> check remaining blockers. The system records state; you supply judgment.

The in-app **Help** page has the shorter version of this journey. On staging, the Workspace is available only to permitted Tailscale users. Your system operator manages access and provider configuration; creators work through the browser.
